

Eldertainment System

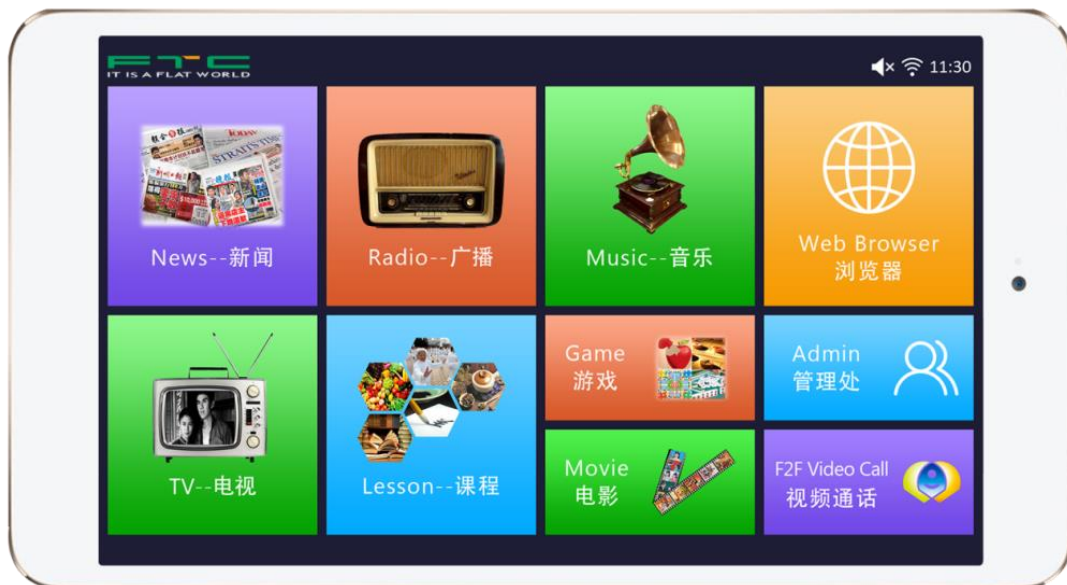

Increase productivity for caregiver and better quality of life for elderly

Created with the intent of promoting healthy ageing, the Eldertainment system is an all-in-one multimedia system with content, games and videoconferencing facilities to help keep elderly parents engaged with their hobbies, mentally active, and in touch with their loved ones.

The intuitive user interface, with image-based shortcuts and larger fonts, was designed for the elderly and validated through focus groups and user immersion tests. Curated TV programs, movie titles and music content are stored in respective multimedia libraries for easy streaming. Custom-designed games help seniors exercise their mental muscles and maintain their cognitive skills. Medication reminder, text, voice and picture messaging are come with the system. The one-touch video call module allows convenient face-to-face interaction with their family and friends, reducing social isolation among the elderly.

The Eldertainment system features a 10" to 12" touchscreen display, with its built-in ageing care modules powered by Android 9.0 with a 3GB of RAM on 32GB of local storage space.

The Eldertainment system is suited for use both in a private setting at home, or in professional geriatric care facilities such as hospitals or elderly nursing homes.
